

Rollover Protective Structures

Risk Assessment Worksheet				
Company: Work Location: Date: Prepared By:				
Task	Sequence of Work	Hazard(s)	Level of risk	Control Method

The risk assessment determines the level of risk that equipment will roll over while being operated. The assessment must consider:

- The equipment’s stability, taking into consideration the equipment’s configuration and any attachments mounted on or manipulated during the operation.
- The ground conditions where the equipment will be operated, including any ditches, drop-offs, holes, soft spots or other irregularities.
- The grades of the ground where the equipment will be operated.
- The loading and unloading of the equipment from transport floats.
- The overall nature of the work to be done.
- Any applicable safe work procedures or instructions provided by the employer/owner.
- The operator’s training and experience.
- The level of direct supervision of the operator while using the equipment.
